MnemoShare

Secure data exchange for a zero-trust world

MnemoShare replaces static credentials and standing access with identity-bound, ephemeral exchange — fully auditable, Kubernetes-native, and designed for modern compliance.

Identity-bound access | Ephemeral credentials | Immutable audit trail | SSO + mTLS

HIPAA | SOC 2 | ISO 27001 | HITRUST | NIST

DESIGNED TO SUPPORT AUDIT AND COMPLIANCE EVIDENCE

HIPAA | SOC 2 Type II | ISO 27001 | HITRUST | NIST CSF 2.0

MnemoShare helps teams produce defensible evidence around access, authentication, transfer activity, and administrative actions — without relying on long-lived credentials or opaque appliances.

MnemoShare

Compliance answers shouldn't stop being true after a breach

Modern organizations still exchange sensitive data using patterns that assume perimeter trust, static endpoints, and long-lived secrets. That model breaks down the moment credentials are compromised
— which is how most incidents actually happen.

The Challenge

- **Long-lived credentials** (SSH keys, service accounts) become permanent attack surface
- **Standing access** accumulates over time (vendors, ex-employees, shared accounts)
- **Legacy transfer systems** weren't designed for today's threat landscape
- **Audit trails** are often incomplete, hard to export, or not evidence-grade

The MnemoShare Solution

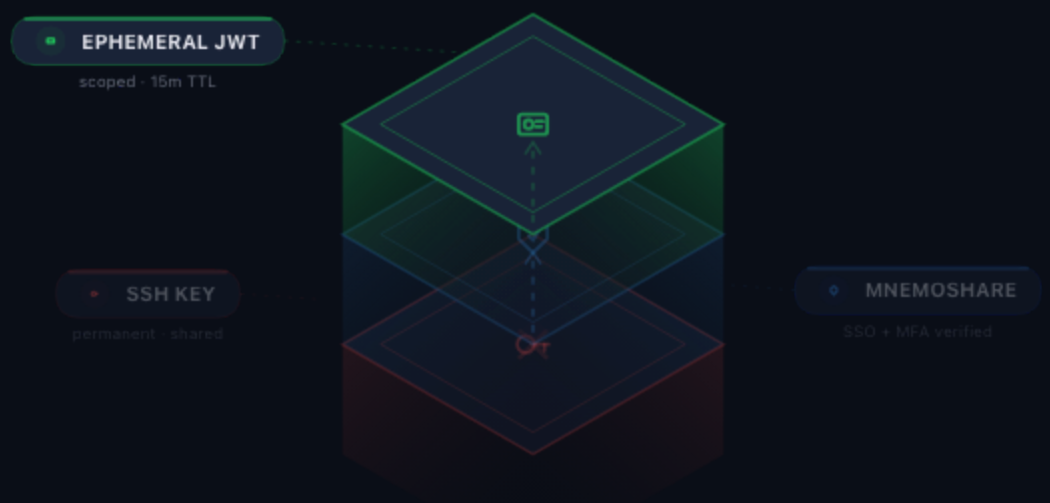
- **Identity-bound exchange** — access tied to real users/services via SSO/OIDC and mTLS
- **Ephemeral credentials** — short-lived JWTs instead of permanent keys
- **Policy-driven control** — approvals, lifecycle rules, and automated enforcement
- **Auditable by construction** — immutable event logs designed for investigations and compliance

From static keys to ephemeral tokens

MnemoShare replaces permanent SSH credentials with identity-verified, auto-expiring JWT

MnemoShare

~~ssh-rsa AAAA...~~ → eyJhbGciOi... (15m TTL)



~~LEGACY~~

Static SSH Key

The problem

NEVER EXPIRES

- Permanent attack surface
- Manual rotation required
- Shared across engineers

STEP 1

MnemoShare

Identity verification

SSO + MFA

- Identity verified via SSO
- Multi-factor authenticated
- Policy engine evaluated

STEP 2

Ephemeral JWT

The solution

EXPIRES: 15 MIN

- Identity-bound & scoped
- Auto-expires, no rotation
- Immutable audit trail

Security controls built for modern audits — and modern breaches

Everything is designed to reduce credential-based risk, enforce least privilege, and produce evidence-grade audit trails.

Protect data in transit and at rest

AES-256-GCM encryption at rest and TLS 1.3 in transit. SHA256 checksums verify file integrity. Client-side encryption options available for end-to-end protection.

- End-to-end encryption mode
- Integrity verification
- Secure key management

Structured Audit Events

Every security-relevant action generates a structured audit event. Export to customer-managed WORM storage and/or your SIEM for compliance and investigations.

- Operational visibility + evidentiary export
- WORM storage support (S3 Object Lock)

SIEM integration

MnemoShare

Identity Provider Integration

SSO via OIDC and SAML with Azure AD, Okta, Ping, and more. MFA enforcement across all access. TOTP available as fallback.

- SSO/OIDC/SAML
- MFA enforcement
- TOTP fallback

Least Privilege Access Control

Role-based permissions with scoped access at per-collection and per-workflow levels. Domain-based exceptions for trusted partners.

- Admin, User, Guest roles
- Scoped access policies
- Domain whitelisting

High-Throughput Transfers

Designed for high-throughput transfers with parallelism and resume. Direct multipart streaming to S3 with zero memory overhead.

- Parallel chunked transfers
- Zero-knowledge upload
- Instant resume on failure

MnemoShare

Verification and Approvals

Approval workflows and recipient verification before file access. Time-bound access with automatic link expiry.

- Custom validation questions
- Approval workflows
- Time-bound access

Content Scanning and Quarantine

Real-time malware scanning via ClamAV/ICAP before storage. PHI/PII detection module identifies sensitive data with auto-quarantine option.

- ClamAV + YARA rules
- PHI/PII detection
- Auto-quarantine option

Email Security Gateway

Policy-driven inbound and outbound email protection. Detects PHI, PII, and PCI data in bodies and attachments — then redacts, extracts to secure links, or blocks based on your DLP policy.

MnemoShare

- 40+ DLP detection patterns
- Auto-extract sensitive attachments
- Postfix / corporate mail integration

Hardware-Backed Identity

Non-exportable private keys bound to hardware security modules. Supports YubiKey PIV, macOS Secure Enclave, Windows Hello TPM 2.0, and Linux TPM.

- FIPS 140-3 ready
- NIST 800-63B AAL3
- Enterprise+ tier

When data must move — and security must be provable

Built for organizations that exchange sensitive data and answer hard questions.

Regulated Partner Exchange

- **PHI/PII transfers:** Share patient records, claims data, and member information with identity verification at every step
- **Vendor onboarding:** Secure ongoing file drops without permanent credentials or standing access
- **Claims and billing:** Exchange billing documents, authorizations, and financial data with full audit trail
- **Clinical research:** Transfer trial data and patient consent forms with configurable retention

MnemoShare

Secure Client Deliverables

- **Financial documents:** Share loan documents, portfolios, and compliance reports with time-bound access
- **Insurance packages:** Transfer policy documents, underwriting data, and claims with recipient verification
- **Tax and audit:** Share tax returns, financial statements, and audit reports securely with clients
- **Legal discovery:** Exchange sensitive documents with chain of custody and immutable logs

The Modern Alternative to Legacy File Transfer

We removed the two most exploited components in enterprise file transfer: permanent SSH private keys and vulnerable monolithic MFT appliances.

MnemoShare

- **SFTP with 10-year-old RSA keys**
  Permanent credentials that accumulate and can't be revoked across deployments
- **FileZilla / WinSCP clients**
  Desktop apps with no audit trail, no SSO, and stored credentials
- **MOVEit, Accellion, classic MFT**
  A class of legacy MFT appliances that has experienced repeated high-impact vulnerabilities in recent years
- **Home-grown WebDAV portals**
  Memory-bound, single-server architectures that can't scale

MnemoShare Advantage

- **Zero long-term credentials anywhere**
  Short-lived JWTs + optional mTLS with hardware-bound keys
- **Modern web UI + Outlook add-in + CLI**
  SSO integration with Azure AD, Okta, Ping — enforced MFA everywhere
- **Modern, minimal attack surface**
  Designed to reduce the blast radius of vulnerabilities — horizontally scalable with no monolithic components
- **Zero memory overhead, true horizontal scaling**
  Direct multipart streaming to S3 — no single point of failure

RFP-ready: "We exceed SFTP public key requirements with short-lived certificates + MFA + JWT, eliminating the permanent private key problem entirely."

Replacing Legacy File Transfer?

Deploy Your Way

Same security architecture, same compliance controls — choose the deployment model that fits your organization.

Managed Cloud (SaaS)

Dedicated isolated instance, fully managed by MnemoShare. Start transferring files in minutes.

- Instant provisioning — live in under 5 minutes

7-day free trial on all plans

MnemoShare

Automatic updates and patching

No infrastructure to manage

Start Free Trial →

Self-Hosted

Deploy within your own infrastructure with full control over data, networking, and identity.

- Docker, Kubernetes, or Helm charts
- Your storage (AWS S3, GCS, MinIO)
- Your identity providers and encryption keys
- Multi-cloud and air-gapped ready

View Self-Hosted Plans →

CLI for Automation and Power Users

Copy

```
# Install mnemocli (macOS)
$ brew install mnemoshare/tap/mnemocli

# Upload files with parallel transfers
$ mnemocli upload file1.pdf file2.doc --concurrent 5

# Download with progress tracking
$ mnemocli download abc123def456 --output ./downloads
```

Cross-platform CLI supports Windows, macOS, and Linux. Available via Homebrew, [illegible] and Chocolatey package managers. See our documentation for the deployment guide
